

Task 12

- a). Adding IoT devices to Smart Homes using Packet Tracer
- b). Connect and Monitor IoT Devices using Packet Tracer

IoT Devices are physical objects embedded with sensors, software, and other technologies that enable them to connect to the internet and exchange data with other devices, systems, or users. They are part of the **Internet of Things (IoT)** ecosystem, designed to automate processes, enhance efficiency, and provide real-time data insights.

Key Features:

- **Connectivity:** Can connect to networks (Wi-Fi, Bluetooth, or wired).
- **Sensors/Actuators:** Collect data or perform actions (e.g., turning on a light, adjusting temperature).
- **Automation:** Operate automatically based on predefined conditions or commands.
- **Remote Control:** Can be controlled or monitored from anywhere via the internet.

Examples: fan, light, door, security cameras

WRT300N home router -> Under network devices->sub category 4th option (wireless devices)

Click on wireless devices->WRT300N (from last 4th option)

IoT devices (like fan, door) -> Under End devices -> sub category 2nd option (home)

Click on home -> drag and drop fan and door

Description of the network

Radius server:

RADIUS server (Remote Authentication Dial-In User Service) can control access to IoT devices by implementing centralized **authentication, authorization, and accounting (AAA)** mechanisms

When a user or device (e.g., PC or smartphone) attempts to control or access an IoT device (e.g., fan, door, or lamp), the access request is sent to the RADIUS server via the router.

The RADIUS server verifies the credentials (e.g., username and password, token, or certificates) provided by the user/device.

If the credentials are valid, the RADIUS server grants access to the network resources; otherwise, it denies the request.

WRT300N router

WRT300N is a wireless router commonly used in networking simulations (like in Cisco Packet Tracer) and real-world scenarios to provide network connectivity.

Its primary purpose is to act as a gateway between connected devices and the wider network (e.g., the internet or a local network).

PC:

The PC hosts the IoT server or monitoring software, enabling centralized control and management of connected IoT devices.

It acts as the interface for users to monitor the status or control devices (e.g., turning a lamp on/off or unlocking the door).

IoT Devices:

Fan:

- A smart device that allows remote control of its operations, such as turning on/off and adjusting speed.

Door (Smart Lock):

- Allows secure, remote locking/unlocking of doors.
- Monitors door status (open/closed) for enhanced security.

Configurations:

Configuring radius server

Under config->Give device name as radius server

IP address:192.168.0.10 subnet mask:255.255.255.0

Default Gateway:192.168.0.1

The screenshot shows a window titled "Radius server" with a tabbed interface. The "Desktop" tab is selected, and within it, the "IP Configuration" sub-tab is active. The "IP Configuration" section has a blue header bar with a close button (X). It contains two main sections: "IP Configuration" and "IPv6 Configuration".

IP Configuration:

- ☐ DHCP
- ☒ Static
- IPv4 Address: 192.168.0.10
- Subnet Mask: 255.255.255.0
- Default Gateway: 192.168.0.1
- DNS Server: 0.0.0.0

IPv6 Configuration:

- ☐ Automatic
- ☒ Static
- IPv6 Address: (empty field) / (empty field)
- Link Local Address: FE80::201:64FF:FEA4:5995
- Default Gateway: (empty field)
- DNS Server: (empty field)

802.1X:

- ☐ Use 802.1X Security
- Authentication: MD5 (dropdown menu)
- Username: (empty field)
- Password: (empty field)

At the bottom left of the window, there is a "Top" button.

Under services click -> AAA ->click service=on radio button

Do the following as in the below screenshot

Radius server

Physical Config **Services** Desktop Programming Attributes

SERVICES

- HTTP
- DHCP
- DHCPv6
- TFTP
- DNS
- SYSLOG
- AAA**
- NTP

Client Name	Client IP	Server Type	Key
1 home	192.168.0.1	Radius	pass1234

Add Save Remove

User Setup

Now setup for user i.e user setup

Need to add username and password for iot devices

In username tab enter fan and in password 1234 and click add. same way do for all devices

User Setup

Username Password

	Username	Password
1	door	1234
2	fan	1234
<div></div>		

Add

Save

Remove

Under services click->IoT->service=on

Configuration for Wireless router

Config->give display name as home

In GUI->click on wireless and enter the below shown configuration

And scroll down and click on save settings

In GUI->under wireless->right side option click on security and add the below shown config

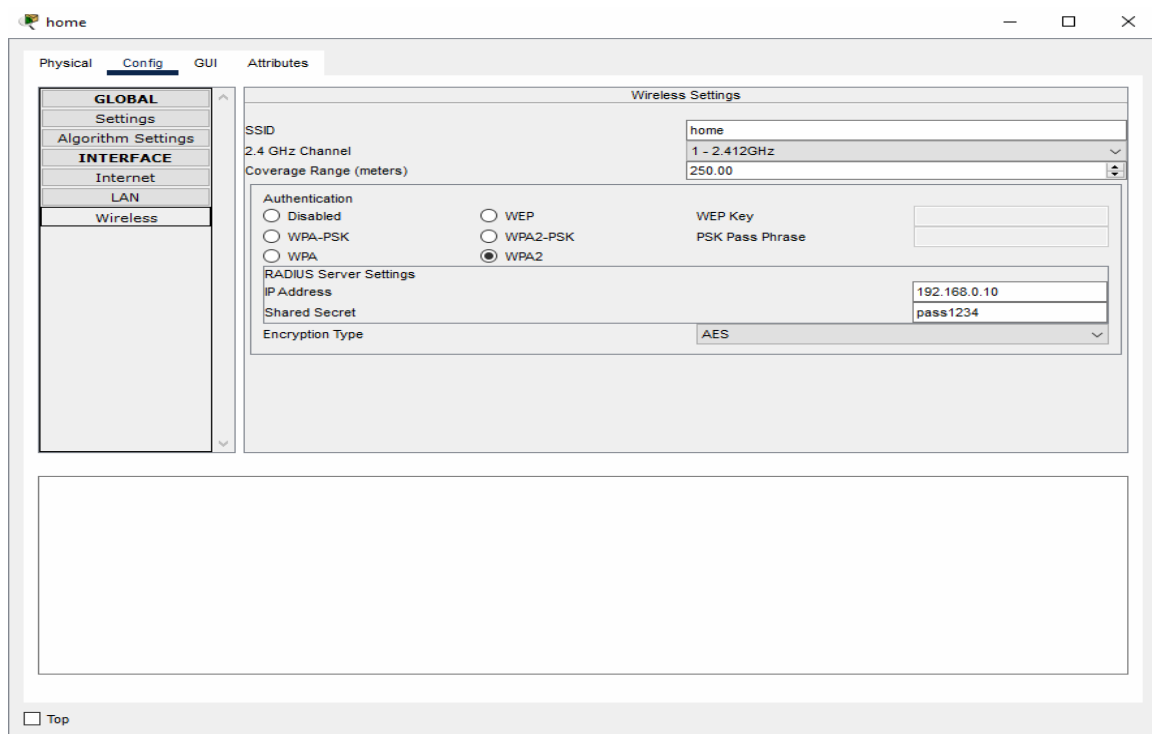

And scroll down and click on save settings

To check if all configurations which we gave are added

Goto->config in router->>wireless

Configuration for PC

Select DHCP

Configuration for fan

Goto->config->change the display name as fan

Goto->settings->follow the screenshot

In settings->configure remoteserver as shown below

This screenshot shows a configuration window for an IoT Server. It features three radio buttons: 'None', 'Home Gateway', and 'Remote Server', with 'Remote Server' selected. Below these are three text input fields: 'Server Address' (192.168.0.10), 'User Name' (admin), and 'Password' (admin). A 'Connect' button is located at the bottom right of the configuration area. The window has a 'Top' link and an 'Advanced' button at the bottom.

Below is the screenshot we get after connecting

This screenshot shows the 'fan' configuration window with the 'Config' tab selected. The left sidebar shows a tree view with 'GLOBAL' (Settings, Algorithm Settings, Files) and 'INTERFACE' (Wireless0, Bluetooth). The 'Wireless0' interface is selected, showing its configuration. It includes sections for 'Gateway/DNS IPv4' (DHCP selected, Default Gateway: 192.168.0.1, DNS Server: 0.0.0.0), 'Gateway/DNS IPv6' (Automatic selected), and 'IoT Server' (Remote Server selected, Server Address: 192.168.0.10, User Name: admin, Password: admin). A 'Refresh' button is at the bottom right. The window has a 'Top' link and an 'Advanced' button at the bottom.

In config->wireless0 do below configuration

We will get link line between router and devices if both got connected successfully as shown in the below screenshot

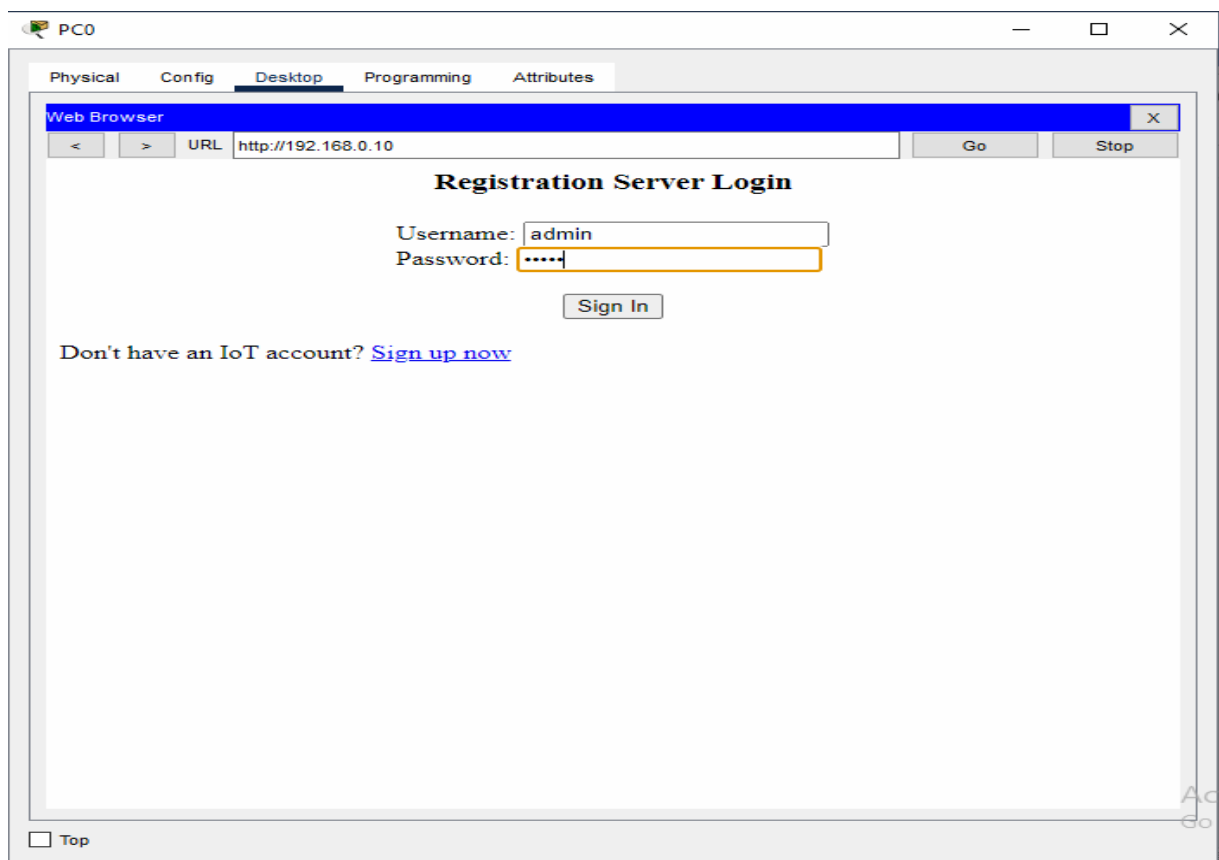

Testing

We on/off the fan and door from the PC

Goto PC->Desktop->webbrowser->give <https://192.168.0.10> and register as shown below

Then signin after registration

Once signin we will get below screen as it screenshot

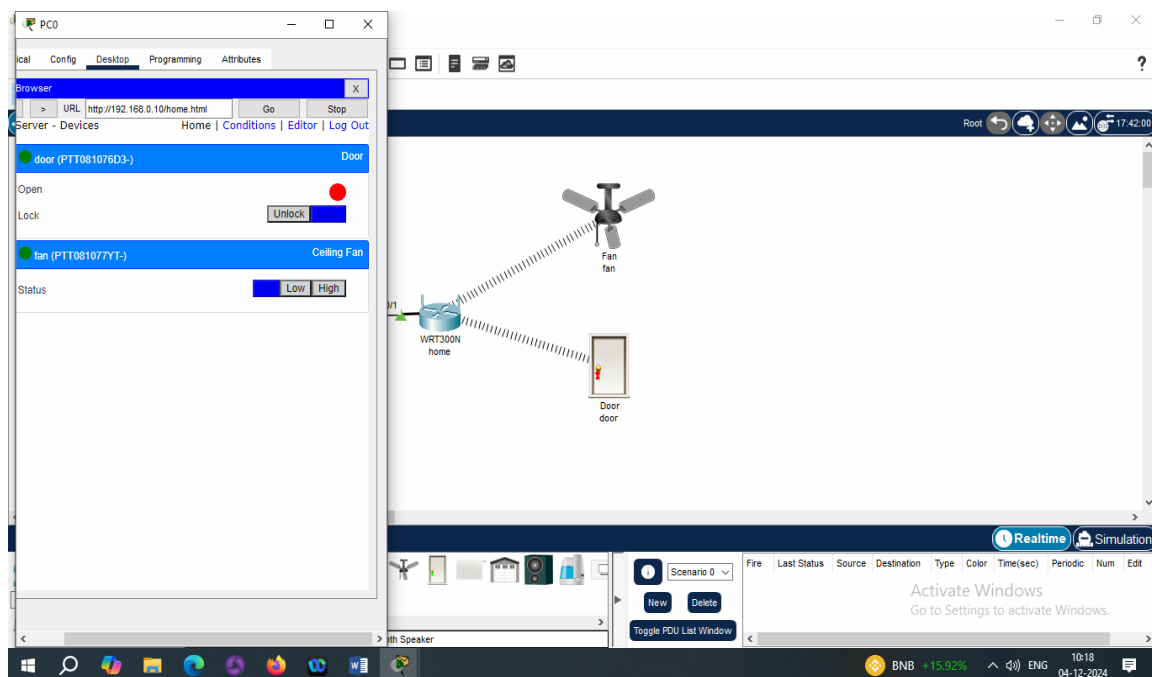

Iot devices gets added and we can operate

Note: If ur not able to see devices added check if DHCP is enabled in PC->config

Click on small arrow left of fan and we can see controls for on/off and for door lock/unlock

Door turns red if we click on lock and turns green if we click unlock

For fan if we click on low, vibration is less and if we click on high, vibration will be more as shown in below screenshot
